

Read. Think. Annotate.

PageBuddy is a fullscreen PDF reader designed around the way people actually read, study, think, and write.

There is no separate edit mode. No annotation mode. No switching back and forth.

Use your finger to read.

Use Apple Pencil to write.

Pick up the Pencil and start annotating directly on the page.

Reading and writing belong together.

Traditional PDF applications often separate reading from editing. Before writing something down, the reader may need to find a markup tool, switch modes, select a pen, and then switch back to reading.

PageBuddy removes that interruption. The document remains the center of the experience while Apple Pencil is available for writing directly on the page.

"The best annotation interface is the one you do not have to think about."

A reader should be able to underline an important sentence at the moment it becomes important, circle an unfamiliar concept, or write a short thought before it disappears.

The goal is not to turn reading into editing. The goal is to allow thinking to happen without interrupting reading.

Try annotating this page

1. Underline the sentence you find most important.
2. Circle the phrase that best describes PageBuddy.
3. Write a short note in the margin.
4. Draw an arrow connecting two related ideas.

Your PDFs stay where they are.

PageBuddy works with PDF files stored in folders selected by the user. It does not require importing an entire library into a separate application vault.

The original PDF remains unchanged while you read and annotate. PageBuddy stores annotation information separately from the original document.

Original PDF

remains unchanged.

Annotations

are stored separately and associated with the document.

Export

creates an annotated PDF when you want to share or save your annotations outside the app.

This approach makes it possible to preserve the original document while still allowing the reader to make the book their own.

Annotation exercise

Imagine you are studying this document for an exam.

- Underline the most important concept.
- Draw a box around the feature you would use most.
- Add a short handwritten summary next to the callout.

Pick up where you left off.

Reading is rarely completed in a single session. A book may be opened for a few minutes in the morning, revisited later in the day, and returned to weeks afterward.

PageBuddy remembers information associated with the documents you read, including reading progress and annotations.

When the same document appears again in one of the folders tracked by the app, PageBuddy can recognize it and restore information associated with that document.

"A good reading tool remembers the book, not just the file."

Reading progress and annotation data can also synchronize between compatible devices through Apple's iCloud services when available and enabled.

Test persistence

1. Add a few annotations to this page.
2. Close the document.
3. Open it again in PageBuddy.
4. Verify that annotations remain available.

Make this page yours.

This page intentionally leaves space for testing handwriting, drawing, underlining, circling, arrows, and free-form notes.

Apple Pencil test

Try all of the following:

- Write your name below.
- Draw a small diagram.
- Underline this sentence.
- Circle the word **PageBuddy**.
- Draw an arrow somewhere on the page.
- Write a short note about your reading experience.

That's PageBuddy.

Open a PDF. Read it. Pick up your Apple Pencil when you have something to say.

No edit mode.

No annotation mode.

No need to stop reading.

Just read. Think. Annotate.

For App Review

This PDF is provided as sample content for testing the core functionality of PageBuddy, including PDF reading, fullscreen navigation, Apple Pencil annotation, annotation persistence, and reopening a previously annotated document.
